UNM HEALTH SCIENCES CENTER

VISION

The University of New Mexico Health Sciences Center will work with community partners to help New Mexico make more progress in health and health equity than any other state.

MISSION

We will provide an opportunity for New Mexicans to obtain an excellent education in health sciences, advance health discovery and innovation in the most important areas of human health and ensure that all populations in New Mexico have access to the highest-quality health care.

CORE VALUES

The UNM Health Sciences Center's mission is guided by our values of excellence in education; patient care and research; commitment to service; quality and safety; integrity and accountability; respect and compassion for all people; teamwork and collaboration and providing hope for those we serve.

RICHARD S. LARSON, MD, PhD

Executive Vice Chancellor for Health Sciences

I'm very pleased to report that the UNM Health Sciences Center was awarded a record \$205.8 million in external research funding during FY 2020, representing net growth in 15 of the past 16 years.

This remarkable achievement is especially significant given the epic challenges faced by academic health centers like ours in the face of the COVID-19 pandemic. I'm extremely proud of the way our faculty, staff and students stepped up to keep our research enterprise on track this year.

We recently received a third five-year renewal of our Clinical and Translational Science Award from the National Institutes of Health, and in coming months we anticipate renewal of the UNM Cancer Center's comprehensive designation by the National Cancer Institute.

These achievements are truly a tribute to your drive and hard work. UNM HSC scientists are advancing the understanding, diagnosis and treatment of many diseases, including asthma, cancer, stroke, Alzheimer's disease, substance abuse, heart disease and behavioral health conditions.

Our work extends beyond the lab: our faculty members conduct

research in underserved and rural areas throughout New Mexico, where they are improving access to care, addressing chronic disease and increasing access to clinical trials and state-of-the-art technologies.

Research distinguishes academic health centers like ours from other health care providers. In fact, the integration of research, education and clinical care at academic health centers drives much of the innovation in the U.S. health care system. We should all be proud of our contributions to the advancement of health and health care in our nation.

Through our grant funding, the UNM HSC research mission provides tremendous economic impact and job creation for New Mexicans. New discoveries and patents stimulate business creation and support a growing bioscience industry. Most important, our research has a powerful impact on health care, both locally and nationally.

As I frequently remind friends and colleagues, research brings hope, and I'm confident that in the coming year we will play a vital role in improving health care in New Mexico, the U.S. and the world. ■

I am so pleased with the scholarly work being done on our campus. I am proud of each researcher and his or her research project – even more so when that research will ultimately have a positive effect on the health of New Mexicans.

This year, I want to highlight some of that research, as well as our learners who are doing research. Their work speaks for itself!

Kimberly Page, PhD, MPH, professor in the Department of Internal Medicine, received a \$2.8 million grant from the National Institute on Drug Abuse for the New Mexico Clinical Trials Node, which will enable clinical research and practice to address substance use in diverse, rural and underserved populations. This work has special relevance for New Mexico, which has long had one of the highest opioid overdose mortality rates.

Akshay Sood, MD, professor in the Department of Internal Medicine, received a \$700,000 grant from the National Institute of General Medical Sciences to promote mentor interventions among Underrepresented Minority Researcher faculty at three Southwestern institutions and expand the scientific scope of the National Research Mentoring Network.

Yuri Yoshida, PT, PhD, director of the Fred Rutan Gait and Motion Analysis Laboratory, has won recognition for providing a deeper empirical understanding of biomechanics and muscle physiology regarding functional recovery after total knee arthroplasty.

And as you'll read in this issue, School of Medicine faculty are leading two of the three interdisciplinary Grand Challenges initiatives set in motion last year by University president Garnett S. Stokes.

Janice Knoefel, MD, professor in the Departments of Internal Medicine and Neurology, co-leads the Successful Aging initiative, which will work to raise the threshold of functional status at which a person can remain independent, allowing individuals to have the resources to age in place.

Brandi Fink, PhD, assistant professor in the Department of Psychiatry & Behavioral Sciences, co-leads the Substance Use Disorders initiative. This Grand Challenge will take a coordinated, multi-systems approach to address substance use in New Mexico, making use of evidence-based implementation projects.

Meanwhile, the Community of Scholars, founded by medical students who desired a more intensive research experience, has evolved into a registered student organization. Participants work closely with faculty to explore their areas of interest, dedicating vacation and elective time to research. Many have secured grant funding, presented results at national meetings and published their findings in peer-reviewed journals.

Thank you to all of our researchers whose work improves the health of New Mexico and the world! ■

MARTHA COLE MCGREW, MD

Executive Vice Dean, School of Medicine

CHRISTINE KASPER, PhD, RN

Dean College of Nursing

The College of Nursing is adapting in the face of the COVID-19 pandemic as it prepares the next generation of nurses to address urgent health care needs and improve health for New Mexicans, the nation and the world.

Nurses, consistently rated as the most trusted health care professionals, have an obligation to develop new approaches and methods through our practice and research.

I'm pleased to welcome Patricia Watts-Kelley, PhD, RN, FNP-BC, to the College as associate dean for Research and Scholarship. She brings extensive research and mentoring experience that will grow our scholarship and research programs while increasing our extramural funding.

Dr. Watts-Kelley is a retired Navy captain who has held research and leadership positions within the federal government, including health sciences officer in the Department of Veterans Affairs Office of Research & Development. She also held the position of deputy director of Nursing and Allied Health Research at the Navy Medicine Headquarters. She served as the first Navy executive director of the TriService Nursing Research Program and she was director of research services at the National Naval Medical Center.

Her research focuses on clinical knowledge development and continuity of care for wounded service members, military and veteran caregiver burden, health promotion and self-care management for those living with complex chronic conditions.

Dr. Watts-Kelley will further our goal of being recognized as a premier Nursing Research Intensive College, as our scientific investigations look at health through a nursing lens and approach urgent health care needs with our interdisciplinary approach.

Our faculty in the Departments of Bio-Behavioral Health and Rural Health and Equity have signature strengths in health care disparities and equity, oncology and toxicology, genomics, self-management of complex chronic conditions, military and veteran health, gerontology and caregiver burden, eHealth, health services and policy research.

We are proud of our outstanding alumni, who are changing the face of health care around the world. You'll find UNM nurses in neonatal and geriatric units across the nation and in hospitals and academic health centers around the globe. Our graduates lead military medical commands, schools of nursing, national nursing organizations, health care systems and federal agencies.

Onward and upward! ■

College of Pharmacy researchers are committed to improving the health of New Mexicans, including our most vulnerable populations, and tackling the world's most challenging and public health issues. In the last fiscal year they received more than \$10 million in extramural funding.

Beyond dollars, 2020 was a year that demonstrated the responsiveness of College researchers and the impact that our research has had during a global pandemic. When the COVID-19 began to spread throughout New Mexico last spring, our researchers jumped into action.

The New Mexico Poison and Drug Information Center teamed up with the Department of Health to establish the state's COVID-19 hotline to communicate rapidly evolving information. The team also alerted the Food and Drug Administration to a rash of methanol-based hand sanitizer poisonings, which helped to prompt a nationwide warning and eventual product recalls.

Other researchers received NIH funding to explore the impact of increased COVID-19 related stress across minority communities already affected by historical trauma.

The College continued its environmental health research with the renewal of our NIH P50 center, which

draws on longstanding partnerships with indigenous communities to study the health implications associated with exposure to wastes from abandoned mines, combined with microplastic and other plastic degradation products, and most importantly, to develop critical mitigation strategies.

The College also received an NIH P20 Center of Biomedical Research Excellence grant focusing on the adverse health outcomes of metal contaminants in the Southwest, as well as on harnessing the chemical properties of metals for therapeutic and nutritional purposes.

Our substance abuse disorder research focuses on prenatal alcohol exposure, epigenetic studies and naloxone distribution. We also had continued success in the both clinical and foundational research in cardiovascular disease, infectious disease (particularly HIV and vaccines) and pharmaceutical dosage formulation studies.

Clearly, the impact of our research reaches throughout New Mexico and the U.S., and I am very proud to work with such talented and dedicated faculty, staff and students across the research spectrum to translate biomedical and pharmaceutical science discoveries into improved patient care. ■

DONALD GODWIN, PHD

Dean College of Pharmacy

TRACIE COLLINS, MD, MPH

Dean College of Population Health

The COVID-19 pandemic has posed significant challenges for us this year in the College of Population Health – but the good news is we have seen significant advances in our research mission alongside the growth of enrollment in our degree programs.

I'm pleased that our signature Transdisciplinary Research, Equity and Engagement Center for Advancing Behavioral Health – the TREE Center – has received supplemental grant funding to develop COVID-related infectious disease modeling.

Assistant professor Shannon Sanchez-Youngman, PhD, received TREE Center supplemental funding for her partnership with the San Miguel Family and Community Health Council in which she helped teens in Las Vegas, N.M., write and produce digital story frameworks involving their experiences related to the risk factors associated with suicide. It's hoped the intervention will promote new ideas for suicide prevention.

Elsewhere in the College, associate professor Francisco Soto Mas, MD, PhD, MPH, is conducting occupational safety and health

research focusing on organic farmers, a subgroup of agricultural workers who have been neglected by national injury and illness surveillance systems. His team has established a new Assessment, Planning & Evaluation Unit (APEU) that provides technical assistance to community organizations and state agencies.

Assistant professor Laura Nervi, PhD, MPH, MSSc, partners with APEU in several projects, leading cooperation with a community primary clinic in Albuquerque, and a Clinical & Translational Science Center grant to address language and health literacy barriers among Spanish speakers through a smart-assisted learning program. She also continues a line of research on global health policies.

I'm continuing to develop a project I started while at the KU School of Medicine in Wichita involving the use of a smart phone app to promote healthy eating to address chronic conditions like peripheral artery disease in overweight adults. We hope to see additional testing to gauge its long-term effectiveness.

I'm extremely proud of our College's research achievements, and I'm looking forward to seeing where they will lead in the coming year. ■

Pandemic Response

When COVID-19 Came to New Mexico, Health Sciences Researchers Stepped Forward to Study the Novel Coronavirus

By Michael Haederle, Michele Sequelra and Kara Leasure Shanley

As the COVID-19 pandemic spread around the globe last spring University of New Mexico Health Sciences Center researchers sprang into action to study the novel coronavirus and search for lifesaving treatments.

For some, the pandemic was an occasion to revisit earlier work. Graham Timmins and Vojo Deretic posted a previously unpublished paper suggesting that the common antibiotics azithromycin and ciprofloxacin might have lung-protecting properties.

Timmins a professor in the College of Pharmacy, and Deretic, professor and chair of the Department of Molecular Genetics & Microbiology, reported on a decade-old study of azithromycin as a treatment for cystic fibrosis patients, who commonly suffer from lung infections.

Azithromycin alleviates symptoms of the disease, which inflames the tissue lining the bronchial tubes, but it appears to help even when patients don't have an active infection. Similarly, when the coronavirus assaults the lungs, they become inflamed as the body mounts a ferocious immune response, but runaway inflammation can turn deadly, causing multiple organ failure.

Timmins and Deretic think the chemical properties of azithromycin

and ciprofloxacin might be key. Both are weak bases, with a pH higher than 7.0. They suspect the drugs neutralize acids within endosomes – tiny membrane-bound compartments inside the lung cells – that can trigger inflammation.

"Even small changes in pH change the ways those sites in the cells work," Timmins says. "We think that's the way these drugs work."

In another collaboration, a **trio of University of New Mexico scientists** turned to machine learning to cull through a "library" of thousands FDA-approved drugs to identify candidates that could be repurposed as treatments for the COVID-19 infection.

The effort was launched in late March, when the team started looking for – and testing – known drugs that might have antiviral properties, said Tudor Oprea, MD, PhD, professor and chief of the Translational Informatics Division in the Department of Internal Medicine.

Oprea and his team used sophisticated computational methods to comb through the university's [DrugCentral](#) database, which tracks drugs approved by the U.S. Food and Drug Administration, as well as those approved for use elsewhere in the world.

Oprea classified each drug molecule according to which viral proteins it might target, enabling him to pinpoint the mechanism by which it might disable a virus – a critical first step. He partnered with Larry Sklar, PhD, distinguished professor in the Department of Pathology and director of the Center for Molecular Discovery, which maintains a collection of drug samples.

"Tudor identified molecules in the library that would be tested," said Sklar, who screened them using a highly efficient method called assay

miniaturization. Drug candidates were then passed on to Steven Bradfute, PhD, assistant professor in UNM's Center for Global Health, who tested them against the live virus in his Biosafety Level 3 laboratory.

The UNM team then shared its list of candidates with the National Center for Advancing Translational Sciences (NCATS) to see whether NCATS could confirm their findings

As SARS-CoV-2 coronavirus reproduces, variations appear in its genetic code. Accumulating over time, these changes are like fingerprints, leaving a telltale trail of clues about where the virus has been – and where it might be headed.

HSC researchers Darrell L. Dinwiddie, PhD, and Daryl Domman, PhD, took on the role of genomic detectives to help crack the case.

Dinwiddie, an assistant professor in the UNM Department of Pediatrics, sequenced coronavirus samples in his molecular genomics lab.

Dinwiddie collaborated in the analysis with Domman, PhD, an assistant professor in the Department of Internal Medicine who specializes in genomic epidemiology and has had prior experience following outbreaks of cholera around the world.

They partnered with SARS-CoV-2 SPHERES, a national consortium of research universities and public health departments sponsored by the National Center for Emerging and Zoonotic Infectious Diseases (a branch of the Centers for Disease Control and Prevention) that pooled crucial information about the virus.

The coronavirus genome is encoded in strands of a molecule called RNA. Minor changes in the sequence of nucleotides within the strand provide information about how closely related one viral sample is to another.

The consortium used these samples to create a viral family tree. A preliminary analysis of samples collected in New Mexico suggested there were multiple introductions of the virus into the state, which is consistent with early reports of cases among people who had traveled abroad or domestically.

Genomic variation in viral reproduction is a natural process. "For the SARS-CoV-2 the rate of genomic change has been fairly stable," Dinwiddie said. "We know

Steven Bradfute, PhD

Bryce Chackerian, PhD

Vojo Deretic, PhD

Darrell Dinwiddie, PhD

Tudor Opea, PhD

Christina Salas, PhD

Graham Timmons, PhD

how quickly it changes. Based on that information we can make predictions about how far back different samples have gone."

Meanwhile, in the Department of Molecular Genetics & Microbiology, longtime collaborators David Peabody, PhD, and Bryce Chackerian, PhD, joined the worldwide race to develop a vaccine to prevent COVID-19 infections.

Over the years they have used virus-like particles to tailor vaccines that can attack a host of different targets, including human papilloma-virus, malaria and even metastatic breast cancer cells.

In this case, Peabody said, "We make a virus-like particle that displays on its surface bits of SARS-CoV-2, and if those bits of SARS-CoV-2 elicit antibodies that neutralize the virus, that's a vaccine." The pair partnered with Bradfute's lab at the Center for Global Health, and Kathryn Fietze, PhD, and Alison Kell, PhD, in Molecular Genetics & Microbiology to test their vaccine candidates.

"We make a virus-like particle that displays on its surface bits of SARS-CoV-2," Peabody said. "And if those bits of SARS-CoV-2 elicit antibodies that neutralize the virus, that's a vaccine."

Center for Global Health faculty also turned their attention to studying patterns of SARS-CoV-2 infection under the guidance of director Douglas J. Perkins, PhD.

A team visited University of New Mexico Hospital to look for fomites: something in the environment that could carry infection. Team members swabbed surfaces around the hospital that could be contaminated with the virus, including personal protective equipment and the exposed skin of health care workers.

In the lab, Perkins and his team isolated RNA from the swabs to see if any of it was from SARS-CoV-2. If they found viral RNA, the team exposed cultured cells to that contaminated sample to see if the virus will grow.

Another team collected nasopharyngeal swabs and blood samples from COVID-19 patients hospitalized at UNMH to study their immune responses. They categorized the samples as severe or non-severe based on the patients' symptoms and survival. Then, the samples were subjected to next-generation sequencing to discover what gene networks differed between the two categories.

"Once you find emergent pathways that are good for discriminating between the groups, you go in and look specifically at that pathway and all the genes in it," Perkins explained. This helped researchers determine what drugs might block "severe disease genes" and test how they work in the severe patients' blood cells.

Christina Salas, PhD, an assistant professor in The University of New Mexico Department of Orthopaedics & Rehabilitation usually focuses on biomedical engineering problems, like developing new joint replacements.

But when the COVID-19 pandemic reached New Mexico she and a team of volunteers, engineering students and research assistants manned

3D printers to produce thousands of protective face masks and face shields, most of which found their way to the Navajo Nation.

In August, Salas and flight nurse Laura Kief Shaffer, her partner on the mask-printing project, were featured among "The Badass 50, Healthcare Workers Who Are Saving the Day" in *InStyle Magazine*.

The mask-printing effort was launched after Shaffer, who was helping to transport patients from hospitals in Gallup, found workers there wearing bandanas instead of surgical masks and wrapping themselves in plastic bags because they lacked sufficient PPE to safely work around COVID patients. Shaffer's plea for help found its way to Salas, who was ready with a technical solution.

The masks are made in four color-coded sizes. Each 3D printer can create multiple masks at a time, an automated process that takes 12 to 14 hours. Afterwards, the volunteers sand each mask down to remove excess filament and package it for shipping.

The soft plastic mask hugs the face, and a detachable cartridge holds commercially available air conditioning filters capable of blocking the passage of the coronavirus. The masks can be wiped down with alcohol or hydrogen peroxide – or sterilized with ultraviolet light – and are reusable.

Salas has made frequent trips to Gallup hospitals and eastern Navajo chapters to assess the need for PPE. "We bring along donations of food, water and diapers – you name it – anything someone might need a disaster relief situation." ■

Scientific Support

Domenici Hall to Host Brain Injury and Substance Use Disorder Research

By Robert Oliver

The University of New Mexico Health Sciences Center has received \$4 million in funding from the National Institutes of Health to expand facilities at the Pete and Nancy Domenici Hall to support Interdisciplinary Substance Use and Brain Injury (ISUBI) research with state-of-the-art equipment and laboratory space.

Executive Vice Chancellor Richard Larson, MD, PhD, in collaboration with Bill Shuttleworth, PhD, professor and chair of Neurosciences, Brandi Fink, PhD, associate professor in the Department of Psychiatry & Behavioral Sciences, and Ludmila Bakhireva, MD, PhD, MPH, professor in the College of Pharmacy, applied for the Biomedical Research Facilities Co6 matching funds grant to create a new core facility to further

interdisciplinary research into substance use and brain injury.

Domenici Hall is already the site of ongoing brain-focused research. Construction is estimated to be completed by Summer 2022, and although there may be delays due to the COVID-19 pandemic, the prospect of new research space has already stimulated the development of new grant funding and novel research at UNM HSC.

"Brain injury and substance use are two research areas that are critical for New Mexico," Shuttleworth said. "This facility will be invaluable for bringing together the best talent in the region, and create the critical mass needed to tackle tough problems."

Neuroscience integrates ultrafine research at the cellular and molecular level, animal behavior, human-based

brain functional studies – and ultimately, human behavior itself.

With this in mind, the grant task force sought to develop a facility where all of these levels of research could occur in the same space. "The ground floor focuses on preclinical work, while the second floor houses clinical research and 'big-data' analyses," Shuttleworth said.

"Having everyone in the same building, and sharing common resources increases efficiency, but also provides the opportunity for 'coffee pot' talk between researchers in different neuroscience subfields," he said. A molecular neurobiologist and a clinical MRI researcher might come up with an entirely new way of solving a research question in the course of a short conversation in between experiments. ■

The new facility will also allow for the seamless combination of research strategies at different levels for more holistic research projects, including “wet lab” molecular research spaces, animal behavioral facilities and novel human-focused research laboratories – some of the most state-of-the-art research spaces in the state, and possibly the Southwest.

One human behavioral suite will be an “apartment” laboratory, designed to mimic an everyday living space. It will allow researchers to study interpersonal relationships between subjects performing everyday chores or cooking.

An alcoholism-focused laboratory seeks to reconstruct a bar

environment to study the effect of alcohol-related cues that could lead to relapse. This facility will be used in conjunction with a group therapy center to develop better interventions to mitigate a patient's propensity to relapse in response to these cues.

The bar laboratory might also be used in conjunction with human brain-imaging facilities to study how activity in specific brain regions shifts in response to those cues.

The promise of this new facility has already stimulated new collaborations among UNM researchers. Development of the new facility was also integral to recent renewal of the UNM Center for Brain Recovery and Repair, an NIH-funded COBRE

center grant led by Shuttleworth to develop interventions for stroke and traumatic brain injury.

“The main point of the building is to provide nationally competitive resources to attract best researchers regionally and increase the critical mass of investigators working on these two topics (brain injury and substance use) that are of such critical importance of communities around New Mexico,” Shuttleworth said.

“We want to create critical mass of the best and brightest in the region working on these important problems,” he said. “Creating a state-of-the-art physical home is a big step forward, and we’re excited to get to work.” ■

Major Milestone

UNM to Launch New Alzheimer's Disease Research Center

By Michael Haederte

The National Institute on Aging has awarded a three-year \$3.1 million grant to establish an exploratory Alzheimer's Disease Research Center at The University of New Mexico that will provide care and clinical investigation for residents with cognitive decline.

The new center – one of four that are joining an existing network of 31 federally funded Alzheimer's centers – will provide New Mexicans with access to the latest in clinical evaluation, treatment and research for cognitive disorders that will afflict an increasing number of people as the population ages.

"Our exploratory center will prioritize American Indians and other rural and underserved populations in New Mexico," said Gary Rosenberg, MD, director of the UNM Center for Memory & Aging and the principal investigator on the new grant.

"This will be one of the only Alzheimer's centers in the Mountain West," he added. "Except for one in Arizona, there are none in Colorado, Utah, Texas and the other states up to the Canadian border. This gives us unique opportunities to improve dementia care in New Mexico and surrounding states."

The new centers mark a strategic expansion into areas of the country that until now have been under-represented in Alzheimer's research. The UNM group will provide an on-site cognitive assessment clinic and use a mobile magnetic resonance imaging scanner to incorporate cognitive and dementia care for Native Americans who reside in rural areas of New Mexico.

The scanner is operated by the Mind Research Network, which shares quarters on the UNM Health Sciences campus with the Center for Memory & Aging. Once the COVID-19 threat subsides, the study will begin on New Mexico reservations and pueblos with the Mobile On-Site Screening and Testing program.

The Center will also focus on co-morbid diseases in a partnership with several pueblos established by UNM scientist Vallabh "Raj" Shah, PhD, who has spent a quarter century working with Zuni Pueblo to help mitigate health effects of diabetes and kidney disease. Shah is joining in this new initiative, as these diseases are major contributors to cognitive decline and dementia.

While UNM's new exploratory center will enhance relationships between the School of Medicine and the state's American Indian communities, it will also engage those with memory disorders throughout the state to participate in clinical care, treatments and research, Rosenberg said.

The grant provides funding for three years to establish and enhance cognitive care and research programs at UNM, Rosenberg said. This will pave the way for a successful competition to transition to a fully established Alzheimer's Disease Research Center that will serve as a long-term resource for New Mexico. ■

The new centers mark a strategic expansion into areas of the country that until now have been under-represented in Alzheimer's research.

Gauging the Risks

UNM Metals Superfund Study Evaluates Toxic Exposures in Southwestern Native American Communities

By Rebecca Sena

By some estimates, 600,000 Native Americans in the Southwest live within 10 kilometers of abandoned hard rock or uranium mines, where they are exposed to metals in the soil, air and water.

The University of New Mexico METALS Superfund Research Program Center, funded by a \$1.3 million grant from the National Institute of Environmental Health Sciences, seeks to determine the toxic effects of metal exposure in Native American populations.

METALS Center director Johnnye Lewis, PhD, Research Professor in the College of Pharmacy, explains how metal exposure affects these communities.

"Exposure during active mining was shown to increase the risk and severity of kidney disease, while community exposure, or the exposure that occurs from waste that is left behind, increases the likelihood of developing hypertension and other chronic diseases, such as diabetes and cardiovascular disease," she says.

Although some health impacts of metal exposure are well established, "it has not been as straightforward as we thought to figure out how the exposures are happening," Lewis says. Laguna Pueblo and the Navajo communities of Red Water Pond Road, and Blue Gap/Tachee have partnered with UNM to gain more insight.

Studies have primarily focused on uranium exposure, but it has become apparent that "virtually every metal you can think of contaminates these sites," Lewis says.

The METALS center takes a multidisciplinary approach, with collaborations occurring between UNM Main Campus and the Health Sciences Center. Main Campus experts are focusing on the environmental aspects of the study, including the movement and transport of mine waste, while HSC faculty are focusing on the biology.

One project looks at the toxic effects of metal exposure on a cellular level and has already unearthed some exciting discoveries.

"Uranium and arsenic, both of which are in the waste we look at, were found to inhibit the ability of the body to repair damage to DNA," Lewis explains. Essentially, these metals can attach to pockets in DNA molecules to prevent the binding of zinc, a necessary element critical for the function of a DNA-damage repair protein.

"The interesting thing about that finding was if you had a sufficient amount of zinc in the system, it outcompetes the metals to restore the function of the protein," she says. Unfortunately, a large percentage of the Navajo community are zinc deficient, which really "sets up the perfect storm," Lewis says. This work is still

ongoing, and researchers continue to learn more about how various metals interact in the process of DNA repair.

Another major problem that Lewis and her colleagues encounter with metal exposure in the Native American population is immune dysfunction.

"We started looking at the immune response, because clinicians saw a need to treat much more aggressively for infectious disease," Lewis says. "Inflammation produced by these metals in various systems is one of the fundamental problems that we are seeing."

The production of cytokines, the chemical messengers that mediate the immune response, are also believed to contribute to the reported immune dysfunction.

Lewis believes that the collaborative efforts and community involvement of the METALS Center benefits everyone.

"When you bring that many perspectives in on it, it creates a synergy that you do not get in an individual lab," she says. The ultimate goal of the METALS project is not only to better understand how exposure is occurring, but to reduce the risk of exposure and develop an effective intervention.

"It's not just about understanding our basic science mechanisms, but how we can use that knowledge to reduce the risk that people are facing to drive better cleanup, break exposure and reduce effects." ■

Diving Into the Data

New College of Nursing Research Sheds Light on Health Policy

By Michael Haederte

Data-driven medical records analysis that promises to shed light on major health policy challenges underpins several new research initiatives launched within The University of New Mexico College of Nursing over the past year.

Dean Christine Kasper, PhD, RN, and doctoral student LisaMarie Turk, MSN, RN, are collaborating on a study of de-identified medical records to characterize the transition to adult health care for young people with special health care needs. The work is being supported by a subaward from the UNM Clinical & Translational Science Center.

"It's exciting because it's a doctoral student who got this award," said Patricia Watts-Kelley, PhD, FNP, who earlier this year was appointed Associate Dean for Research and Scholarship for the College. "It's really a big deal, and it's kudos to Dr. Kasper and to Lisa Marie."

Turk, who has a sibling living with epilepsy, has a personal interest in the question of how to help young people living with chronic conditions effectively transition to health care as an adult.

"This study is aiming to characterize, model and simulate the transition of individuals, particularly adolescents and emerging adults with medical burdens and health care needs, and their transition to adult

health care as opposed to pediatric health care," she says.

"We know that poor transitions are associated with frequent visits to emergency rooms and other forms of high-intensity care, because there is a known gap that occurs between pediatrics and adulthood."

Turk says the study, which is collecting data from more than 700 hospitals and health care facilities, has significant policy implications. "One of the known issues is the loss of the typical funding source or insurance, because that changes oftentimes in adulthood," she says. "There is a variation in policy and clinical applications across the country."

Children with special health care needs, such as intellectual disabilities, neurodevelopmental issues, autism, cerebral palsy, cancer, diabetes and sickle cell anemia, have better prospects than once was the case.

"Given our advances in medical treatment, children who typically didn't live far into adulthood are now living into adulthood," Turk says, "but the clinical applications haven't caught up."

In a second study, the College of Nursing is partnering with Sandia National Laboratories in a Cooperative Research and Development Agreement to bring cutting-edge artificial intelligence and machine-learning techniques to bear

to study the impact of COVID-19 outbreaks on hospital surge capacity.

Associate professor Mary Pat Couig, PhD, MPH, RN, in partnership with Dean Kasper and Sandia researchers Patrick Finley and Drew Levin, is applying modeling and advanced data analytics to an electronic medical records database to shed light on the problem.

Focusing both on New Mexico and the nation as a whole, the team seeks to identify the populations known to be at higher risk. Where is the nearest access to health care and what is the capacity to provide those services?

Sandia scientists bring broad modeling and analytics expertise to the project, while Couig's team is applying their extensive expertise in public health emergency preparedness.

One outcome, they say, is to design quantitative data-driven risk predictors to better anticipate future hospital case loads, outcome metrics and suggested courses of treatment based on patient demographics and medical history.

This timely collaborative research agreement could also open the way for broader application of artificial intelligence, data analytics and modeling across a wide range of nursing, health care and public health issues in New Mexico. ■

LisaMarie Turk, MSN, BSN

Storytelling Solution

Developing Unique Interventions to Stem Teen Suicide in Rural Communities

By Rebecca Roybal Jones

For a year and a half, Shannon Sanchez-Youngman, PhD, worked with youth leaders in the tight-knit community of San Miguel County to learn about the stressors they face and come up with interventions to prevent teen suicide among Latinos.

The result was a series of digital stories created by the youth leaders.

Now, the research scientist with UNM's College of Population Health is working to expand the study to include more young people in rural New Mexico. She collaborates with the Transdisciplinary Research, Equity and Engagement Center for Advancing Behavioral Health (TREE).

The research pilot aimed to uncover the causes of stigma related to suicide, particularly around Latino populations and rural communities, as well as to look beyond the usual mental health services, Sanchez-Youngman says.

"Many teens really talked about feeling isolated at times and pressured by social media to sort of be the model of perfect kids in the community," she says. "But inside, they were facing a lot of feelings of anxiety and pressure to get out of the community."

The pilot study brought together youth leaders and members of the San Miguel Family and Community Health Council, which represents a coalition of 17 organizations.

The teen dialogues led to the creation of a set of digital stories that were

shared with local policymakers and their parents. Their goal was to create a new community health agenda aimed at tackling some of those issues, "rather than just simply focusing on clinical interventions," Sanchez-Youngman says. "And that's not to say that clinical interventions don't matter."

The new \$146,000 grant from the TREE Center and the National Institute of Minority Health and Health Disparities will allow her to help teens share their perspectives regarding stigma and build a youth summit so they can work with local health workers, parents and elected officials to create new policy solutions and community-level interventions to tackle the issues.

"These are kids that seemingly have perfect lives, right? They're athletes, they're getting good grades," Sanchez-Youngman says. "But underneath it all, they really revealed a lot of inadvertent community pressure on them to succeed because they're under a spotlight in a rural town, and that's really important."

"This is really about rural youth and feeling like they were under a constant microscope to sort of live out where their parents failed, and also to make the community proud."

For teens who aren't at the top of their class, Sanchez-Youngman expects to find different struggles involving marginalization.

"When populations experience inequities in health or disparities in

health – Latino, Latina youth – (they) may be more likely to commit suicide compared to whites," she says. "Some of the explanation has to do with their position in society. And so the expectation is that these social determinants of health explain partly how people experience mental health issues."

For example, she says, an immigrant whose parents crossed over to the United States from Mexico may worry about deportation, hostility in the community and where the next paycheck is coming from.

"Let's compare it back to those leaders," Sanchez-Youngman says. "Those youth were feeling a sense of stigma and marginalization by the pressure to be perfect, which is a very different process than maybe a kid whose mom is hooked on opioids. And there's shame associated with that. But this work is very much interested in how those social conditions impact a sense of belonging, a sense of whether I can succeed or not, which are different mechanisms."

The San Miguel County pilot study will expand to include more youths and other communities, so that participants can share their stories with each other and work to propose ideas to community leaders on addressing their stressors.

The work is mainly done by teens for teens with professional support so that they'll be able to reach out to other kids. "The stories are what make a difference," she says. ■

Double Honors

Angela Wandinger-Ness Receives 2020 Presidential Award for Excellence in Science, Mathematics and Engineering Mentoring

By Michael Haederle

The last out-of-town trip Angela Wandinger-Ness, PhD, took before the COVID-19 lockdown was to Seattle, where, on February 15, she received the 2020 Lifetime Mentor Award from the American Association for the Advancement of Science (AAAS).

Six months later, Wandinger-Ness, a professor in The University of New Mexico Department of Pathology who serves as associate director for education, training and mentoring and the Victor and Ruby Hansen Surface Endowed Professor in Cancer Cell Biology and Clinical Translation at the UNM Comprehensive Cancer Center, received the 2020 Presidential Award for Excellence in Science, Mathematics and Engineering Mentoring.

Wandinger-Ness was among 12 researchers who were honored with the award on August 3 – this time virtually – in an online ceremony presided over by Robert Mayes, program director for Excellence Awards in Science and Engineering at the National Science Foundation.

The award, billed as “the Nation’s highest honors for mentors who work with underrepresented groups to develop fully the Nation’s human resources in STEM,” comes with a \$10,000 honorarium.

“It’s incredibly humbling to be the recipient of these really prestigious awards this year,” she said. “It’s really with the support of the trainees and mentees who feel you’ve made a

difference in their lives. It’s deeply meaningful.”

Wandinger-Ness, who joined the UNM faculty in 1998, studies GTPases, a family of enzymes that operate as molecular switches in many different cellular functions. She currently is looking for way to translate her work into potential therapies for ovarian cancer. Her research has been funded by the National Science Foundation, American Heart Association, National Institutes of Health, Department of Defense and private foundations.

She has twice been singled out by her colleagues at the UNM Health Sciences Center for the annual Excellence in Research Award and was nominated for the Presidential award by Valerie Romero-Leggott, MD, the HSC’s vice chancellor for Diversity, Equity and Inclusion.

Wandinger-Ness has made mentorship a centerpiece over the

course of her 33-year career, having personally mentored 74 students and fellows in her laboratory. Her trainees, from five continents, bring their diverse abilities, culture, educational opportunity, gender, race/ethnicity and socioeconomic backgrounds to solve complex problems. Her mentees encompass more than 370 students, postdoctoral fellows and junior faculty.

She has been honored by being elected a fellow of the AAAS, the world’s largest scientific society, in 2012.

“You become part of a network of people who are like-minded, and therefore you can connect more broadly across the country and have a bigger impact,” she said of her membership in the society. “You can use that capital to help your trainees more, to connect more, to learn more and bring new things to your work area.” ■

SOUND INVESTMENT

UNM's T32 Programs Provide Critical Support for Graduate Students and Postdoctoral Fellows

By Yamhilette Licon Muñoz

Ruth L. Kirschstein made history as the first woman to direct one of the National Institutes of Health. An active promoter of training programs to mentor underrepresented scientists, she knew the importance of investing in scientists to ensure the advancement of knowledge.

The Ruth L. Kirschstein Institutional National Research Service Award – also known as the T32 award – is a major training program supported by the National Institutes of Health (NIH).

The University of New Mexico Health Sciences Center currently has three T32 training programs: The Alcohol Research Training Program, the Cardiovascular Research Training Program and the Infectious Disease & Inflammation Program.

All three programs are designed to support the careers of graduate students and postdoctoral fellows.

"The Alcohol Research Training Program in Neurosciences provides graduate students with multidisciplinary research training that prepares them for a successful career in alcohol research," says training program director Fernando Valenzuela MD, PhD. "Currently, we have four graduate students enrolled in the program".

This program is funded by a T32 grant from the National Institute

of Alcohol Abuse and Alcoholism (NIAAA) and the research focus includes different areas of alcohol neuroscience research, such as Fetal Alcohol Spectrum disorders, alcohol craving, dependence, tolerance and withdrawal, and the stress, hormonal and cognitive effects of alcohol.

The award provides tuition, fees, insurance and stipend support from the NIH and NIAAA. In addition, students receive funds for research supplies and travel expenses to scientific meetings. "We help the students to network with other experts in the field," Valenzuela says.

The UNM Center for Infectious Disease and Immunity has developed the Infectious Disease & Inflammation Program (IDIP) T32 training grant. Under the direction of Michelle Ozbun PhD, this program studies infectious and immunologically mediated diseases.

IDIP accepts four predoctoral students and two postdoctoral fellows and pairs trainees with mentors. Mentors are experts on the infectious diseases and immunity field at UNM, the UNM School of Medicine and the Lovelace Respiratory Research Institute.

UNM's Cardiovascular Research Training Program (CRTP) is funded by a T32 grant from the National Heart, Lung, and Blood Institute (NHLBI). The CRTP currently

funds six predoctoral and two postdoctoral trainees.

The CRTP consists of 25 mentoring faculty from 12 basic science and clinical departments and/or colleges, including 15 professors, four associate professors and six assistant professors. The areas of research include vascular biology, cardiovascular toxicology, cell signaling and clinical/translational science.

"Our CRTP provides an integrative approach to understand the mechanisms of cardiovascular disease," says Thomas Resta PhD, current director of CRTP. "We have mentors who work both in basic science and translational research."

The quality and variety of mentors has contributed to the success of UNM's T32 programs. To be funded, NIH requires a strong group of

To be funded, NIH requires a strong group of established scientists with high expertise on the field.

established scientists with high expertise on the field. The existence of the T32 grants has propelled the development of concentrations of coursework and journal clubs designed to ensure specialized training in the areas of cardiovascular physiology, infectious disease and inflammation and alcohol research.

To be part of the program, NIH requires trainees to be U.S. citizens or permanent residents and to work with a mentor who is part of the T32 award. The trainees themselves are huge contributors to the T32 program's success, measured in large part by how many go on to accomplished research careers.

"We have improved the program over the years using the feedback from our students," Valenzuela says. ■

Training Grants 2020

Rosstin Ahmadian, PhD Candidate

T32 Scholar, NIH

Oxidant signaling in pulmonary hypertension

Mentor: Thomas Resta, PhD

Eduardo Anaya

T32 Scholar, NIAID

Infectious Disease, Cell Signaling, Biophysics

Camden Bair, PhD Candidate

T32 Scholar, NIAID

The impact of human adenovirus type 4 intratypic genetic variability on viral pathogenesis

Mentor: Adriana Kajon, PhD

Victoria Balise, PhD

K12 Scholar, NIGMS

Hematopoietic stem cells

Mentor: Jennifer Gillette, PhD

Daniel Barto, PhD

K12 Scholar, NIH

Computational psychiatry; neural markers of psychological disorders; developmental neurobiology

Mentor: Elaine Bearer, MD, PhD

Cindy K. Blair, PhD, MPH

KO7 Scholar, NCI

Developing and disseminating home-based interventions to improve the health and well-being of underserved cancer survivor populations

Roger Brown, PhD

T32 Scholar, NIAID

Developing bioinformatics methods for studying RNA processing events in cellular differentiation of the immune system

Mentor: Scott Ness, PhD

Janie Rae Byrum, PhD Candidate

T32 Scholar, NIAID

T cell immunology, particularly motility of T cells in lymph nodes and the molecular and structural factors that facilitate target cell identification

Mentor: Judy Cannon, PhD

Sharina Desai, PhD

T32 Scholar NIAID

T cell trafficking during ovarian cancer disease progression in the peritoneal tumor environment

Mentor: Sarah Adams, MD

Tammi Duncan, PhD

K12 Scholar, NIH

The potential role of zinc as a way to attenuate the carcinogenic effects of environmental metals on DNA repair mechanisms

Mentor: Laurie Hudson, PhD

Daniel Falcon, PhD

K12 Scholar, NIH

Studying the role of iron and other micronutrients in the initiation and progression of colorectal cancer

Mentor: Xiang Xue, PhD

Máté Fischer, PhD Candidate

T32 Scholar, NIAAA

Using first trimester-equivalent binge-drinking model to assess alterations to gene expression, cell fate determination and cortical regionalization in human stem cell-derived cortical neurons

Mentor: Jason Weick, PhD

Muskan Floren, PhD Candidate

F31 Scholar, NCI

Acute myeloid leukemia resistance and relapse

Mentor: Jennifer Gillette, PhD

Selina Garcia, PhD Candidate

F31 Scholar, NHLBI

Cardiovascular physiology

Mentor: Nikki Jernigan, PhD

Ryan E. Harvey, PhD Candidate

T32 Scholar, NIAAA

Understanding the impact of prenatal alcohol exposure on hippocampal-parahippocampal place, grid and head direction signals

Mentor: Benjamin Clark, PhD

Julie In, PhD

KO1 Scholar, NIDDK

Defining the functional characteristics of Enterohemorrhagic E. coli-Secreted Protein

Mentors: Olga Kovbasnjuk, PhD; Eric Prossnitz, PhD; Jennifer Gillette, PhD; Edgar Boedeker, MD; Mary Estes, PhD

Elton Jhamba, PhD

K12 Scholar, NIH

Developing super-resolution microscopy technologies to study protein-protein interactions on mast cell membranes in allergic responses, as well as the interplay of receptor tyrosine kinases on cancer cells

Mentors: Diane Lidke, PhD; Keith Lidke, PhD

Benjamin Lantz, PhD Candidate

T32 Scholar, NIH

Pulmonary hypertension

Mentor: Laura Gonzalez Bosc, PhD

Daniel A. Lujan, PhD Candidate

F31 Scholar, NCI

RNA biology; breast cancer biology; immunology

Mentors: Rebecca S. Hartley, PhD;

Nora Perrane-Bizzazero, PhD

Adrian J. Luna, PhD Candidate

F31 Scholar, NCI

Investigating the role of EGFR signaling in the HPV life-cycle

Mentor: Michelle Ozbun, PhD

Perenkita Mendiola, PhD Candidate

T32 Scholar, NIH

Identification of endogenous regulators of cystathione gamma-lyase in endothelial cells

Mentors: Nancy Kanagy, PhD;

Laura Gonzalez Bosc, PhD

Emily Morin, PhD

T32 Scholar, NIH

Endothelial cholesterol regulation of vascular tone in hypertension and vascular disease

Mentor: Jay Naik, PhD

Sarah Olguin, PhD Candidate

T32 Scholar, NIAAA

Studying the mechanism of impaired cognitive control after prenatal alcohol exposure using touchscreen-adapted operant behavior, in vivo electrophysiology, EEG recording, and immunohistochemistry

Mentor: Jonathan Brigman, PhD

Erica Pascetti, PhD Candidate

T32 Scholar, NIH

Hematopoietic stem and progenitor cells

Mentor: Jennifer Gillette, PhD

Gabriela Perales, PhD Candidate

T32 Scholar, NIH

Studying novel mechanisms that contribute to the teratogenic effects associated with prenatal alcohol exposure

Mentor: Amy Gardiner, PhD

Melanie Rivera, PhD Candidate

F31 Scholar, NCI

Studying the role of Rac1 protein in the spread of ovarian cancer

Mentor: Angela Wandinger-Ness, PhD

Rebecca Sena, PhD Candidate

T32 Scholar, NIAAA

Researching the impact of prenatal ethanol exposure on histaminergic neurotransmission in the hippocampus

Mentors: Daniel Savage, PhD;

C. Fernando Valenzuela, MD, PhD

Hailey Sedam, PhD

K12 Scholar, NIH

Studying adenoid cystic carcinoma and investigating the molecular mechanisms and genomic signatures of this disease

Mentor: Scott Ness, PhD

Crystal Vander Zanden, PhD

K12 Scholar, NIH

Early aggregation events of amyloid beta (Alzheimer's disease)

Eva Chi, PhD

Nikole Warner, PhD

K12 Scholar, NIH

Using a deep sequence-coupled biopanning technology to characterize the specificity of the antibody response to DENV in sera from infected patients

Mentor: Kathryn Fietze, PhD

Jordan Weisend, PhD Candidate

T32 Scholar, NIH

Cell and molecular mechanisms of protection induced by spreading depolarizations occurring in remaining viable brain tissues following stroke

Mentor: C. William Shuttleworth, PhD

Lea Weston, PhD Candidate

T32 Scholar, NIAID

Investigating the relationship between neuroinflammation and tau pathology. Determining the role of anti-inflammatory cytokine IL-10 in tauopathies, such as Alzheimer's disease

Mentor: Kiran Bhaskar, PhD

Christine Woods, PhD

K12 Scholar, NIH

Examining the contribution(s) of GPER in metabolic homeostasis and determining its therapeutic potential on adiposity and metabolic dysfunction

Mentor: Eric Prossnitz, PhD

Xiang Xue, PhD

Excellence in Research Awards 2019

The UNM Health Sciences Center's 11th Annual Research Day Awards Ceremony was held Nov. 15, 2019. The event, hosted by Executive Vice Chancellor Richard Larson, MD, PhD, and Paul Roth, MD, MS, Chancellor for Health Sciences, recognized six scientists who were nominated by their peers and selected for recognition by a faculty committee on the basis of their outstanding research contributions.

(From left to right) Paul B Roth, MD MS, Chancellor for Health Sciences; Lisa Cacari Stone, PhD; Esther Erdei, PhD, MPH; Angela Wandinger-Ness, PhD; Christina Salas, PhD; Thomas Resta, PhD; Richard S. Larson, MD, PhD

Esther Erdei, PhD, MPH Pharmacy Team Science

As an immunologist and epidemiologist in the Department of Pharmaceutical Sciences, Esther Erdei has been involved in several major population-based studies, particularly in Native American communities in New Mexico and South Dakota. She has

analyzed clinical samples from study participants for various biomarkers of immune impairment. Her reputation in immunology has also landed her on several review boards for NIH grant proposals. Since 2006, she has been co-author on 16 papers with other UNM researchers. These have included both technical papers in immunology and others on the application of immunology to public health.

Thomas Resta, PhD Cell Biology & Physiology Basic Science

Thomas Resta's research focuses on chronic hypoxia and intermittent hypoxia-induced pulmonary hypertension. As a principal investigator, he has maintained continuous funding through the National Institutes of Health and the American Heart

Association for nearly 20 years. He holds an R01 grant examining vascular smooth muscle signaling in intermittent hypoxia-induced pulmonary hypertension. In 2016, he took over as the principal investigator and director of the T32 grant Minority Institutional Research Training Program in Cardiovascular Biology. His research has particular relevance in New Mexico, where the incidence of cardiovascular-related disease is high, especially among the Hispanic and Native American populations.

Lisa Cacari Stone, PhD **Population Health** **Population Science**

Lisa Cacari Stone is the founder and principal investigator for the Transdisciplinary Research, Equity and Engagement (TREE) Center, funded by the National Institutes of Health, which tests multi-level interventions with partner faculty, staff and students drawn from across the UNM campus. She brings "real-life" experience to understanding health and disease as a former licensed behavioral health provider, director for a comprehensive child welfare agency, director of senior services, executive director of a rural federally qualified mental health clinic, state medical director and women's health liaison with the U.S. Department of Health and Human Services.

Christina Salas, PhD **Orthopaedics & Rehabilitation** **Junior Faculty**

With dual appointments in the Department of Orthopaedics & Rehabilitation and the School of Engineering, Christina Salas maintains a busy research and teaching schedule. In her lab she is developing an advanced biomanufacturing process to fabricate bone-ligament tissue scaffolds. She is quickly becoming a leader in the area of advancing biomanufacturing for orthopaedic applications. This year, she was recognized by the National Institutes of Health as a Future Research Leader – one of 25 nationally. She was also an invited panelist for the Advances in 3-D Printing and Biofabrication Workshop at the 2019 Orthopaedic Research Society annual meeting.

Mark Unruh, MD **Internal Medicine** **Clinical Science**

Mark Unruh is a physician scientist who focuses on improving patient outcomes in chronic kidney disease. He has two primary avenues of investigation, the first being the impact of dialysis interventions on patient reported outcomes. The second is investigating sleep quality and sleep disorders in patients with chronic kidney disease with the aim of developing interventions in this at-risk group. He has also worked with community cohorts to describe sleep quality and sleep apnea in the general population and recently completed trials assessing the role of volume overload in the risk of obstructive sleep apnea.

Angela Wandinger-Ness, PhD **Pathology** **Teaching and Learning**

The associate director for Education, Training and Mentoring at the UNM Comprehensive Cancer Center, Angela Wandinger-Ness oversees the Cancer Center's education and training program. Wandinger-Ness, the Victor and Ruby Hansen Surface Endowed Professor in Cancer Cell Biology and Clinical Translation, was awarded a competitive National Cancer Institute Continuing Umbrella of Research Experiences award. Over the past five years, the program has supported the research training of 57 undergraduate and high school Native American scholars at the Cancer Center. She has also had a profound impact on hundreds of trainees in basic, translational and clinical research.

How to Donate to UNM Health Sciences Center Research

Join Us on Our Journey of Discovery

Our research programs are focused on critical health problems affecting New Mexicans and bridging the gap to more rapidly deliver discoveries to the clinical setting. Often, the benefits of our innovations and discoveries are recognized and shared beyond our state borders to institutions in other states and in countries around the world.

Your contributions will help us meet new challenges and seek solutions to help people lead longer and healthier lives. Donations are accepted through the UNM Foundation, the university-based nonprofit that can accommodate almost any giving interest. Options include support of health research in general, work in a particular disease category, one of our signature programs for scholarships or facilities, or a legacy gift customized to fit the wishes of you as an individual, your family or your company.

For more information on how you can contribute to the UNM Health Sciences Center's discoveries and innovations of the future, contact Bill Uher, Vice President of Development, UNM Foundation, at bill.uher@unmfund.org or 505-277-4078.

About the Foundation

The University's Board of Regents established the UNM Foundation in 1979 as a nonprofit corporation. Ten years later, the Regents delegated the responsibility of overseeing University of New Mexico assets and investments to the UNM Foundation Investment Committee. These assets total more than \$400 million today.

In 2008, the Foundation became a stand-alone organization with expanded fiduciary duties to include fiscal, human resources and treasury functions. All private gifts to the Health Sciences Center are received through the UNM Foundation, which manages contributions to all university programs. The Foundation's funding model ensures that 100 percent of gifts are directed to the donor's designated purpose.
