

Healthcare professionals,

Place this “static cling” on a smooth surface in your office as a reminder for steps YOU can take for HPV cancer prevention.

HPV vaccine is safe and prevents cancer!

“Your
11-year old
child is due for
vaccinations.

Today, we can help
protect against
meningitis, HPV
cancers, and
pertussis.”

1 Review patient’s vaccination record before the visit—check for Tdap, Meningococcal and HPV.

2 Recommend HPV vaccine the same way & on the same day as all adolescent vaccines. Use the CDC guide, “Talking to Parents about HPV Vaccine.”

3 Remind parents of the next shots needed. Schedule follow-up appointment before they leave, and remind them with a call/email/card.

REMEMBER

Only 2 HPV shots are needed for kids 9-14 years, at 0 and 6-12 months

If started after 15th birthday,
three doses HPV vaccine needed, at 0, 1-2 and 6 months
